

## **1. Usability**

- What are the primary user personas or target audience?

## **2. Where to be Used (Mobile, Web, etc.)**

- Will the application be a web-based platform, mobile app, desktop application, or a combination?

## **3. Authentication**

- Is multi-factor authentication (MFA) required?

## **4. Authorization**

- What user roles and permissions need to be defined, and should there be an admin interface for managing user roles and permissions?

## **5. Safety**

- How should the system handle error states or unexpected inputs?

## **6. Security**

- Are there any compliance requirements (e.g., GDPR, HIPAA)?

## **7. Privacy**

- What types of personal data will the system collect?

## **8. Scalability**

- What are the expected user numbers and transaction volumes at launch and in the future?
- Are there specific scalability strategies to consider (e.g., cloud, microservices)?
- What are the requirements for disaster recovery and failover?
